

Risk Summary

Preeclampsia

Medium Score: 0.6395082154771051

Model Interpretation: Risk-based triage only (not diagnosis).

Macrosomia

Medium Score: 0.5943816940585895

Model Interpretation: Risk-based coaching support.

Summary: Patient TEST_MED_MED is at 32 weeks gestation. Preeclampsia risk is medium, requiring doctor alert. Macrosomia risk is medium, with elevated pre-pregnancy BMI and slightly high fasting glucose.

Patient Snapshot (Recent Inputs)

Parameter	Value	Notes
Blood Pressure	NA/NA mmHg	Hypertensive threshold ≥140/90, severe ≥160/110.
Proteinuria (dipstick)	NA	≥1+ supports PE suspicion in context of HTN.
Symptoms	Headache=NA, Vision=NA, RUQ Pain=NA, Swelling=NA	Severe features increase escalation priority.
Glucose	Fasting=NA mg/dL 1hr PP=NA mg/dL	Targets typically fasting <95, 1hr <140 (pregnancy goals).
HbA1c	NA	Higher HbA1c indicates sustained glycemic elevation.
Maternal Context	Age=NA BMI=NA GDM=NA	Risk modifiers for fetal overgrowth + metabolic risk.
Activity / Sleep	Post-meal walk=NA min Sleep=NA hrs	Lifestyle factors influence glycemic response.
Food Log		Used for dietary correlation patterns.

Reason for Alert

Action Requested: ALERT_DOCTOR

Clinical Rationale: Patient TEST_MED_MED, 32 weeks gestation, presents with a medium preeclampsia risk. Current readings include BP 142/79 and proteinuria dipstick 1. No other preeclampsia symptoms reported. Macrosomia risk is also medium, with pre-pregnancy BMI 42.4, fasting glucose 99 mg/dL, and HbA1c 5.6%. Please evaluate for preeclampsia and consider macrosomia risk factors in management.

Suggested Next Steps

- Review trend: BP, symptoms, proteinuria, glucose readings
- Consider confirmatory tests (protein/creatinine ratio, LFTs, platelets) if clinically indicated
- Consider GDM diet review or insulin adjustment if glucose targets exceeded
- Provide patient education + return precautions
