

Risk Summary

Preeclampsia

Medium Score: 0.6395082154771051

Model Interpretation: Risk-based triage only (not diagnosis).

Macrosomia

Medium Score: 0.5943816940585895

Model Interpretation: Risk-based coaching support.

Summary: Patient TEST\_MED\_MED is at 32 weeks gestational age with a medium risk for preeclampsia and medium risk for macrosomia. Key concerns include elevated systolic blood pressure (142 mmHg) with proteinuria (dipstick 1) and a high pre-pregnancy BMI (42.4) with borderline fasting glucose.

Patient Snapshot (Recent Inputs)

| Parameter              | Value                                        | Notes                                                      |
|------------------------|----------------------------------------------|------------------------------------------------------------|
| Blood Pressure         | 142/79 mmHg                                  | Hypertensive threshold ≥140/90, severe ≥160/110.           |
| Proteinuria (dipstick) | 1                                            | ≥1+ supports PE suspicion in context of HTN.               |
| Symptoms               | Headache=0, Vision=0, RUQ Pain=0, Swelling=0 | Severe features increase escalation priority.              |
| Glucose                | Fasting=99 mg/dL<br>1hr PP=126 mg/dL         | Targets typically fasting <95, 1hr <140 (pregnancy goals). |
| HbA1c                  | 5.6                                          | Higher HbA1c indicates sustained glycemic elevation.       |
| Maternal Context       | Age=38<br>BMI=42.4<br>GDM=0                  | Risk modifiers for fetal overgrowth + metabolic risk.      |
| Activity / Sleep       | Post-meal walk=29 min<br>Sleep=6.1 hrs       | Lifestyle factors influence glycemic response.             |
| Food Log               | paneer salad                                 | Used for dietary correlation patterns.                     |

Reason for Alert

Action Requested: ALERT\_DOCTOR

Clinical Rationale: ALERT: Patient TEST\_MED\_MED, 32 weeks gestational age, presents with a medium preeclampsia risk tier (0.6395) and medium macrosomia risk tier (0.5944). Key vitals include systolic BP 142 mmHg, diastolic BP 79 mmHg, and proteinuria dipstick 1. No severe symptoms are reported. Pre-pregnancy BMI is 42.4 and fasting glucose is 99 mg/dL. Maternal age is 38. Review required for elevated systolic BP and proteinuria in context of medium preeclampsia risk.

Suggested Next Steps

- Review trend: BP, symptoms, proteinuria, glucose readings
- Consider confirmatory tests (protein/creatinine ratio, LFTs, platelets) if clinically indicated
- Consider GDM diet review or insulin adjustment if glucose targets exceeded
- Provide patient education + return precautions
