

Risk Summary

Preeclampsia

Medium Score: 0.6395082154771051

Model Interpretation: Risk-based triage only (not diagnosis).

Macrosomia

Medium Score: 0.5943816940585895

Model Interpretation: Risk-based coaching support.

Summary: The patient, at 32 weeks gestation, has a medium risk for preeclampsia (score 0.64) with elevated systolic blood pressure (142 mmHg) and proteinuria (dipstick 1). Macrosomia risk is also medium (score 0.59), despite currently controlled glucose levels, likely influenced by high pre-pregnancy BMI. An alert to the doctor is recommended due to the preeclampsia risk.

Patient Snapshot (Recent Inputs)

| Parameter              | Value                                        | Notes                                                      |
|------------------------|----------------------------------------------|------------------------------------------------------------|
| Blood Pressure         | 142/79 mmHg                                  | Hypertensive threshold ≥140/90, severe ≥160/110.           |
| Proteinuria (dipstick) | 1                                            | ≥1+ supports PE suspicion in context of HTN.               |
| Symptoms               | Headache=0, Vision=0, RUQ Pain=0, Swelling=0 | Severe features increase escalation priority.              |
| Glucose                | Fasting=99 mg/dL<br>1hr PP=126 mg/dL         | Targets typically fasting <95, 1hr <140 (pregnancy goals). |
| HbA1c                  | 5.6                                          | Higher HbA1c indicates sustained glycemic elevation.       |
| Maternal Context       | Age=38<br>BMI=42.4<br>GDM=0                  | Risk modifiers for fetal overgrowth + metabolic risk.      |
| Activity / Sleep       | Post-meal walk=29 min<br>Sleep=6.1 hrs       | Lifestyle factors influence glycemic response.             |
| Food Log               | paneer salad                                 | Used for dietary correlation patterns.                     |

Reason for Alert

Action Requested: ALERT\_DOCTOR

Clinical Rationale: URGENT ALERT: Patient TEST\_MED\_MED, 32 weeks gestation, has a medium preeclampsia risk tier (score 0.6395). Key findings include systolic BP 142 mmHg (consistent with hypertension in pregnancy, where ≥140/90 mmHg is considered hypertensive) and proteinuria dipstick 1. Diastolic BP is 79 mmHg. No severe headache, vision changes, upper abdominal pain, or swelling of face/hands are reported. Macrosomia risk tier is also medium (score 0.5944). Recommended action: ALERT\_DOCTOR for clinical review of preeclampsia risk.

Suggested Next Steps

- Review trend: BP, symptoms, proteinuria, glucose readings
- Consider confirmatory tests (protein/creatinine ratio, LFTs, platelets) if clinically indicated
- Consider GDM diet review or insulin adjustment if glucose targets exceeded
- Provide patient education + return precautions
